

Linux Workstation Setup

Skill Name

Linux Workstation Setup

Description

Automates the post-installation environment provisioning of a fresh Linux distro by updating core packages, applying cohesive custom desktop themes, configuring dotfiles and shell aliases, and securely installing privacy and development suites.

Your SKILL.md

name: linux-workstation-setup

description: Automates the post-installation environment provisioning of a fresh Linux distro by updating core packages, applying cohesive custom desktop themes (like pixel art layouts), configuring dotfiles/shell aliases, and securely installing privacy and development suites. Trigger phrases include "Help me spin up my personalized Linux development environment," "Run the automation script to configure my custom desktop theme and privacy tools," or "Set up a fresh Linux workstation from scratch using my dotfiles."

Instructions

1. Receive User Inputs: Ask the user to provide the target Linux distribution (e.g., Ubuntu, Arch), the path or GitHub repository where their configuration dotfiles are stored, and the URL/local path for their custom 4K theme elements (such as pixel art backgrounds).
2. System Update & Core Provisioning: Execute package manager updates and install essential baseline development packages, a window manager, terminal emulators, and the specified privacy applications.
3. Configuration Deployment: Clone the dotfiles repository and symlink the configuration files to their respective target directories (e.g., ~/.config/).
4. Theme Application: Move the custom 4K desktop wallpapers into the system background directory and modify the window manager or desktop environment theme variables to match the intended visual profile.
5. Quality Check & Verification: Verify successful deployment by checking that the configurations load without errors, running a script to test tool availability, and outputting a summary table confirming the status of installed tools and active themes.
6. Final Output: A fully customized, ready-to-use desktop environment matching the user's exact development and visual preferences.
