

Network Security Reconnaissance Data Extraction

Task Name

Network Security Reconnaissance Data Extraction

Description

Transformed multiple unstructured network reconnaissance terminal outputs and error logs into a clean, organized Markdown table documenting open ports, active services, and security vulnerabilities.

Task Summary

Security Reconnaissance Data Extraction Summary

The analysis processed network reconnaissance terminal outputs and error logs, filtering out system noise, formatting artifacts, and irrelevant error codes to extract meaningful security data.

Findings:

IP 192.168.1.50 has SSH service on port 22 running OpenSSH 7.6p1 with medium risk due to an outdated version susceptible to user enumeration vulnerabilities.

IP 192.168.1.50 has HTTP service on port 80 running Apache httpd 2.4.29 with low risk as cleartext traffic is permitted on this standard web server port.

IP 192.168.1.115 has HTTPS service on port 443 running nginx 1.14.0 with informational status as secure web traffic is active and the SSL/TLS certificate is valid.

IP 192.168.1.201 has SMB service on port 445 running Microsoft-DS with high risk as EternalBlue signature patterns associated with MS17-010 were detected in error logs.

IP 192.168.1.201 has RDP service on port 3389 running ms-wbt-server with medium risk as Network Level Authentication appears disabled, creating exposure to brute-force attacks.

System trace logs, unmappable packet drop entries, and recurring connection timeout artifacts were filtered out to maintain clean reporting.
