

Study Guide Compiler

Skill Name

Study Guide Compiler

Description

Automates the repetitive task of parsing, cleaning, and structuring unstructured text files, assignment sheets, and raw programming source code snippets into streamlined, beginner-friendly Markdown study guides for peer tutoring.

Your SKILL.md

name: study-guide-compiler

description: Automates the repetitive task of parsing, cleaning, and structuring unstructured text files, assignment sheets, and raw programming source code snippets into streamlined, beginner-friendly Markdown study guides for peer tutoring. Trigger phrases: "Compile my raw notes and code snippets into a structured peer study guide." "Run the automation to filter out compiler logs and format these programming guidelines." "Turn this messy assignment documentation into a clean, simplified reference sheet."

Instructions

1. Accept and Validate Inputs: Gather all connected source materials, including raw text notes, assignment outlines, and specific code blocks (such as C++ class definitions).
2. Filter and Remove Noise: Parse the documentation to scrub out system logs, redundant compiler warnings, and distracting formatting artifacts.
3. Structure the Core Concepts: Group the remaining information into clean, logical modules based on topic headings and core operational rules.
4. Simplify Technical Terminology: Translate complex code logic and abstract theories into highly accessible, beginner-friendly explanations suitable for peer tutoring.
5. Format the Output: Compile the processed material into a clean Markdown document utilizing clear headers, concise bullet points, and distinct syntax-highlighted code blocks.
6. Perform a Quality Check: Review the finalized guide to verify that no critical functional logic was lost during simplification and ensure the tone remains highly readable before outputting.
